Assessment of TAHBPL

The overall takeaway from our experience with the TAHBPL is that Python is very versatile. However, it has a few quirks that can be annoying at times. Inconsistencies are found throughout the language. There are a lot of libraries available, and many of them seem to be very powerful, however, not many are installed on the Khoury server, which may be something we run into throughout the course of this class. Python's flexibility can be a blessing or a curse, especially as we go into larger scale projects, we may want to integrate type hints into our programs. All in all, although we hit a few snags while using the language, no language is perfect and the wide support for Python and its ease of use make it an interesting language and makes it worth continuing to use through this semester.
